

输出数组、字典的 json 数据

1. 简述：php有两大功能，一个是用来做网页，一个是用来做接口，那么做接口的话，我们都很熟悉，客户端需要接收json数据进行解析，那我们php主要就负责连接数据库，根据客户端的需求，结合请求参数get / post进行数据库中数据的筛选及处理，然后最终组装成一个数组或者键值对(ios中的字典)。下面就分别两种json数据的输出方式进行演示

2. 输出数组

```
array_yunsuanfu.php •
<?php
    $arr = array("fdasf", "dfasfaw", "ttewt");
    echo json_encode($arr);
```

```
[
    "fdasf",
    "dfasfaw",
    "ttewt"
]
```

3. 输出字典

方式1:

```
$dic = array("fsdfa" => "fdsafa", "f3wer" => "faweg", "trgreg" => "rewtbdf");
echo json_encode($dic);
```

```
{
    fsdfa: "fdsafa",
    f3wer: "faweg",
    trgreg: "rewtbdf"
}
```

方式2:

```
$dic1 = ["obj1" => "fdasf", "obj2" => "dfasfaw", "obj3" => "ttewt"];
echo json_encode($dic1);
```

```
{
    obj1: "fdasf",
    obj2: "dfasfaw",
    obj3: "ttewt"
}
```
